

The AI Championship Teams Edition MVP is

- **Micro-learning** (brief instructions)
- **Micro-assessments** (very small skill checks)
- **Micro-actions** (apply what they learned today)
- **Daily check-ins** (usage + confidence + sentiment)
- **Coaching** (simple feedback)
- **Gamification** (XP + streaks)
- **AI Fluency Score** (individual 0–100 skill + habit metric)
- **AI Momentum Score** (team 0–100 organizational metric)
- **Team Dashboard** (light analytics)

✓ We keep 85–90% of the architecture, file structure, DB schema, bot skeleton, and gamification logic exactly as-is from the starter kit.

✓ Most changes are semantic or light logic tweaks, not new systems.

Below is a **complete and final spec**, aligned directly to the PDF you provided.

1 Architecture – What Remains the Same

From the starter kit: Bot, Tab, API, DB, XP/streaks, Adaptive Cards, Manifest, Deployment.
All remain intact.

Teams-duolingo-starter

We are simply repurposing how “lessons” work and adding small tracking features.

2 Repurposing Lessons → Micro-Learning, Micro-Assessment, Micro-Action

The PDF defines *lessons*, *units*, and *exercises* with MCQs and typing.

Teams-duolingo-starter

We will **reuse the lessons table and content JSON**, but now each lesson only contains ONE of the following types:

1. Micro-learning

- 1–2 short instructional steps
- No quiz
- Example: “How to prompt AI to summarize a meeting”

2. Micro-assessment

- ONE multiple-choice question
- Correctness is tracked but DOES NOT affect XP
- Used to track fluency growth
- Includes a “Ask your AI Champion” message field for AI-generated feedback and questions (with strict guardrail on technology related questions)

3. Micro-action

- Simple, practical behavior to apply today
- Example: “Use Copilot to rewrite one email today”
- Includes a “Ask your AI Champion” message field for AI-generated feedback and questions (with strict guardrail on technology related questions)

This aligns perfectly with the existing JSON template structure — we just simplify it and change semantics. We’re aiming for 3 minute check ins.

3 Database Schema – Minimal Additions

The schema provided in the PDF stays almost entirely unchanged.

Teams-duolingo-starter

✓ **Keep as-is:**

- `users`
- `lessons`
- `user_progress`
- `badges`

+ Add Table: `user_daily_logs`

```
CREATE TABLE user_daily_logs (  
  id UUID PRIMARY KEY,  
  user_id UUID REFERENCES users(id),  
  used_ai BOOLEAN,  
  tool_used TEXT,  
  minutes_saved INTEGER,  
  confidence INTEGER,  
  sentiment INTEGER,  -- 1 to 5  
  blockers TEXT,  
  created_at TIMESTAMP DEFAULT now()  
);
```

+ Add Column: `fluency_score`

(Replace “readiness” concept)

```
ALTER TABLE users ADD COLUMN fluency_score INTEGER DEFAULT 0;
```

No other schema changes required.

4 Adaptive Cards – Replace Quizzes With a Single Multi-Part Card

Instead of MCQs for vocabulary (as in the PDF),

Teams-duolingo-starter

we will:

Micro-learning Card

- TextBlock with instruction
- “Next” button

Micro-assessment Card

- ONE Input.ChoiceSet
- Coaching text returned on submission
- XP awarded regardless of correctness

Micro-action + Check-in Card

Inputs:

- “Did you use AI today?” (Yes/No)

- “Confidence after today’s AI use” (1–5)
- “How do you feel about AI right now?” (Sentiment 1–5)
- “How many minutes do you feel you saved (approx)? What was the task?”

On submit:

- Save to `user_daily_logs`
 - Award XP
 - Update streak
 - Recalculate fluency score
-

5 Bot Behavior – Minor Edits

Replace "`start lesson`" triggers in the starter kit bot

Teams-duolingo-starter

with:

- “start”
- “start ai learning”
- A button from the tab: “Start Today’s AI Learning”

Bot flow for a day:

1. Send micro-learning card
2. Then micro-assessment card

3. Then micro-action + check-in

One message per day is enough for MVP.

6 Gamification – Reuse Exactly What You Already Built

The starter kit defines XP, streaks, level-up logic, badges.

Teams-duolingo-starter

We keep EVERYTHING, except:

XP is now awarded for:

- Completing micro-learning
- Completing micro-assessment
- Completing micro-action
- Daily check-in submission

Streak:

- +1 for ANY participation
 - Reset if no interaction that day
-

7 AI Fluency Score (Individual Metric)

(Replaces “readiness” concept)

Purpose:

Tracks **skill + habit growth** for each user.

Inputs:

- Micro-assessment correctness
- Daily usage
- Micro-actions completed
- Confidence
- Streak
- Minutes saved (optional weight)

MVP Formula:

```
function calculateFluencyScore(recentLogs, streak,
microActionsCompleted, assessmentCorrectnessRate) {

  const daysUsedAI = recentLogs.filter(l => l.used_ai).length;

  const avgConfidence = recentLogs.length

    ? recentLogs.reduce((sum, l) => sum + (l.confidence || 0), 0) /
recentLogs.length

    : 0;

  const correctness = assessmentCorrectnessRate || 0;

  let score =

    (daysUsedAI * 3) +
```

```
(avgConfidence * 5) +  
  
(streak * 1) +  
  
(microActionsCompleted * 2) +  
  
(correctness * 15);  
  
if (score > 100) score = 100;  
  
return Math.round(score);  
}
```

Stored in: `users.fluency_score`.

8 AI Momentum Score (Team Metric)

Purpose:

Measures **organizational movement** toward AI adoption + confidence.

Inputs:

- Average Fluency Score
- Fluency growth week-over-week
- % of active users
- % with streaks
- Sentiment trend

MVP Formula:

```
function calculateMomentumScore(teamStats) {  
  const {  
    avgFluency,  
    fluencyGrowth,  
    percentActiveUsers,  
    percentWithStreaks,  
    sentimentTrend  
  } = teamStats;  
  
  const growth = Math.max(0, Math.min(20, fluencyGrowth));  
  
  let score =  
    (avgFluency * 0.4) +  
    (growth * 2) +  
    (percentActiveUsers * 0.1) +  
    (percentWithStreaks * 0.07) +  
    (sentimentTrend * 3);  
  
  if (score > 100) score = 100;  
  if (score < 0) score = 0;  
  
  return Math.round(score);  
}
```

No DB storage required — compute dynamically.

9 Team Dashboard (Admin Tab)

Display the following:

Top-Level KPIs:

- **AI Momentum Score**
- **Avg AI Fluency Score**
- **% Active users (7 days)**
- **Avg Sentiment (7 days)**

Charts/Tables:

- Fluency trend (simple line or static numbers)
- Engagement (XP, streaks)
- Sentiment trend
- Micro-learning completion stats
- Optional: Top 5 users by XP

Simple HTML or 1–2 charts are fine for MVP.

10 Naming & UX Copy Guide (Critical for Consistency)

Replace in UI:

Original Term (PDF)	New Term
Lesson	Micro-learning / AI Tip
Exercise	Micro-assessment
Start Lesson	Start Today's AI Learning
Practice	Assessment
Learning Bot	AI Champions Coach
Correct/Incorrect	"Nice work!" / "Here's guidance..."

Add:

- **AI Fluency Score** (individual metric)
- **AI Momentum Score** (team metric)
- **Micro-action** = applied task
- **Check-in** = daily usage + confidence + sentiment

Backend names (**lessons**, **user_progress**) can stay to save development time.

✓ Summary — What Stays vs What Changes

KEEP (as-is from starter kit):

- Architecture
- Bot skeleton
- Tab skeleton
- DB tables (except 2 tiny additions)
- XP logic
- Streak logic
- Manifest
- Deployment model

ADD (lightweight):

- `user_daily_logs` table
- `fluency_score` column
- Sentiment tracking
- AI Fluency Score function
- AI Momentum Score function
- Team dashboard
- Updated adaptive cards

CHANGE (semantic + logic tweaks):

- Lessons → micro-learning / micro-assessment / micro-action
- XP for participation (not correctness)
- Replace readiness with **AI Fluency Score**
- Add team-level **AI Momentum Score**

Features to prioritize in the MVP

- Simple daily check-in
- Simple micro-action
- XP + streak
- Fluency and Momentum scores
- Individual and Team Level Tracking dashboard

If any part of this materially increases development time, please flag —
our priority is a lean MVP for a 90-day pilot.

Thanks!
Priyanka
